1. Limited Warranty

Avanti Wind Systems A/S warrants that commencing from the date of shipment to the Customer and continuing for a period of the longer of 365 days thereafter, or the period set forth in the standard AVANTI warranty, the Product¹⁾ described in this Manual will be free from defects in material and workmanship under normal use and service when installed and operated in accordance with the provisions of this Manual.

This warranty is made only to the original user of the Product. The sole and exclusive remedy and the entire liability of Avanti under this limited warranty, shall be, at the option of Avanti, a replacement of the Product (including incidental and freight charges paid by the Customer) with a similar new or reconditioned Product of equivalent value, or a refund of the purchase price if the Product is returned to Avanti, freight and insurance prepaid. The obligations of Avanti are expressly conditioned upon return of the Product in strict accordance with the return procedures of Avanti.

This warranty does not apply if the Product (i) has been altered without the authorization of Avanti or its authorized representative; (ii) has not been installed, operated, repaired, or maintained in accordance with this Manual or other instructions from Avanti; (iii) has been subjected to abuse, neglect, casualty, or negligence; (iv) has been furnished by Avanti to Customer without charge; or (v) has been sold on an "AS-IS" basis.

Except as specifically set forth in this Limited Warranty,

ALL EXPRESS OR IMPLIED CONDITIONS, REPRESENTATIONS AND WARRANTIES, INCLUDING, BUT NOT LIMITED TO, ANY IMPLIED WARRANTY OR CONDITION OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, NON-INFRINGEMENT, SATISFACTORY QUALITY, COURSE OF DEALING, LAW, USAGE OR TRADE PRACTICE ARE HEREBY EXCLUDED TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW AND ARE EXPRESSLY DISCLAIMED BY AVANTI. IF, PURSUANT TO ANY APPLICABLE LAW, TO THE EXTENT AN IMPLIED WARRANTY CANNOT BE EXCLUDED AS PROVIDED IN THIS LIMITED WARRANTY, ANY IMPLIED WARRANTY IS LIMITED IN TIME TO THE SAME DURATION AS THE EXPRESS WARRANTY PERIOD SET FORTH ABOVE. BECAUSE SOME STATES DO NOT PERMIT LIMITATIONS ON THE DURATION OF IMPLIED WARRANTIES, THIS MAY NOT APPLY TO A GIVEN CUSTOMER. THIS LIMITED WARRANTY GIVES CUSTOMER SPECIFIC LEGAL RIGHTS, AND CUSTOMER MAY HAVE OTHER LEGAL RIGHTS UNDER APPLICABLE LAWS.

This disclaimer shall apply even if the express warranty fails of its essential purpose.

In any cases of dispute the English original shall be taken as authoritative.

¹⁾Avanti service lift ("Product")

2. Introduction

2.1 Observations

Only trained people may use this lift.

This manual must be available to staff at all times during installation, maintenance and operation.

Additional copies are available from the manufacturer upon request.

This manual, including, but not limited to, measurements, procedures, components, descriptions, instructions, recommendations and requirements, is subject to change without prior notice. Please check Avanti website/manuals for the latest revisions of the manuals.

Any additional cost related to or arising from any changes in the manuals does not entitle Customer to any form of compensation or other legal remedies.

The pictures and sketches in this manual may not reflect the product aesthetics, colours, arrangement precisely. This has no impact on the function or safety.

2.2 Symbols

Symbol	Signal word	Meaning	Possible injury if not observed
Safety instructions			
	DANGER!	IMMEDIATE or possibly imminent danger:	Death or severe injury!
	DANGER!	IMMEDIATE or possibly imminent danger of hazardous voltage:	Death or severe injury!
	CAUTION!	Potentially hazardous situation:	Light injury or material damage.
Additional instructions			
	ATTENTION!	Potentially dangerous situation:	Damage to equipment or workplace
	IMPORTANT!	Useful tips for optimum working procedure	None
		Reference to written specification/documentation	

2.3 Cautions

Use and daily inspection of the service lift shall only be performed by person who has gone through the relevant training associated with the Avanti service lift use and daily inspection and is in possession of a valid (non expired) certificate for the task. Installation and maintenance of the service lift shall only be performed by Certified technicians.

Personnel must be at least 18 years of age. The staff must be familiar with the relevant accident prevention instructions and must have received proper training in these.

Personnel are obliged to read and understand this User's Manual.

Personnel shall wear PFPE (safety helmet, full body harness, shock absorber, lanyard and slider) at all times.

A copy of the User's Manual must be handed out to the personnel and must always be available for reference.

If more than one person is entrusted with one of the above tasks, the employer shall appoint a supervisor in charge of the operation.

Self-locking nuts must be used at all times. The screw must extend from the nut by at least half of the thread diameter. The nut may not be used once it has become possible to loosen by hand! If any damage or faults are found during operation, or if circumstances arise which may jeopardize safety: immediately interrupt the work in progress and notify the supervisor or employer!

All tests/repairs of electrical installations may only be performed by a certified technician.

All repairs to the traction, braking and supporting systems may only be performed by a certified technician.

If any supporting parts are repaired or replaced, the operational safety of the system must be tested and verified by a certified technician.

Only original fault-free parts may be used. Use of non-original parts will render the manufacturer's warranty void and any type approval invalid.

No modification, extension or reconstruction of the service lift is allowed without the manufacturer's prior written consent.

No warranty is provided against damage resulting from reconstruction or modification of equipment or use of non-original parts which are not approved by the manufacturer.

Service lift must be inspected by a certified technician before first use.

Service lift must be inspected at least once a year by a certified technician. In case of high operating frequency or severe conditions of use, more frequent inspection is required.

Service lift is designed for a lifetime of 20 years with an operating frequency of approximately 12.5 h/year (250 h in total).

Service lift may not be used by persons who are under the influence of alcohol or drugs which may jeopardize working safety.

The service lift shall not be used in case of fire in the tower.

Service lift shall ONLY be used when the turbine is not generating power.

All wind farm site specific rules must be followed. Service lift shall not be used during inclement weather, including wind speeds over 25 m/s (55.5 mph).

Avoid injury – follow all instructions!

Owner must verify the need for third party service lift inspections with the local authority and comply with the standards specified.

2.4 Terms and definitions

Terms	Definitions
Certified technician	Person who has gone through the relevant training associated with the scheduled task from Avanti or from a certified trainer and is in possession of a valid (non expired) certificate for the task.
User	Person who has gone through the relevant training associated with the Avanti service lift use and daily inspection and is in possession of a valid (non expired) certificate for the task.

3. Description

3.1 Purpose

The service lift purpose is to transport persons plus their tools and equipment to the most convenient height for performing work in wind turbine generators (WTG).

Its use is limited to authorized users. The access to the WTG and consequently to the service lift is controlled and forbidden to public access.

The service lift is used primarily to transport technicians, their tools and spare parts from the bottom platform (or lowest accessible point) to the top platform (or highest accessible point). It is also used to access intermediate platforms where inspection and service of WTG connecting bolts and other equipment is made.

3.2 Scope

This manual contains instructions for one version of the Shark lift:

- *Shark L 02, sliding door version.*

The product details are described along this manual. The product consists of:

- A service lift, which is formed by: a cabin, a traction system, a fall arrest device, a control system, and safety devices.
- A guiding system along the tower, which is formed by: a pair of steel guiding wire ropes, wire fixes attached to the tower, and guides on the service lift.

3.3 Exclusions

The service lift shall not be used outdoor or in potentially explosive atmospheres. The service lift is not designed to carry a person on its top.

The wind turbine manufacturer is responsible of integrating the service lift and ensuring compliance with the essential health and safety requirements following AVANTI's recommendations.

This will require supply of interface components, including but not limited to:

- Platform fences.
- Power supply protection.
- An evacuation way (e.g. ladder)

3.4 Technical specifications

A third party approval of the final integration might be required depending on the national regulations.

The wind turbine manufacturer shall also provide any additional relevant warning, instruction and / or training specific to the integration of the service lift necessary for its safe and correct installation.

Tower manufacturer's risk assessment shall include a service lift integration study.

Service lift	SHARK L 02
Main door type	Full sliding door
Service lift speed	18 m/min \pm 10 % (50Hz)
	21 m/min \pm 10 % (60Hz)
Rated load	240 kg
Weight of lift (max.)	186 kg
Max. N° persons	2 Persons
Max. travelling height	(1)
Max. noise level	80 dB(A)
Power supply type	400 V (50/60 Hz) 3 Phase + N + PE
	690 V (50/60 Hz) 3 Phase + PE

(1) 120 m, for send/call configuration, and hoist M508 (500 kg).

(1) 140 m, for send/call configuration, and hoist M508 (600 kg).

(1) 160 m, for automatic send configuration, and hoist M508 (500 kg).

Operating temperature

-15°C - +60°C.

Survival temperature

-25°C - +80°C.

Low temperature kit is also available.

Operational temperature for low temperature kit

-25°C - +40°C.

3.5 Dimensions

3.5.1 Dimensions of Shark L 02

3.6 Components

3.6.1 Components of Shark L 02

- 1.Top obstruction device (full plate or frame)
- 2.Emergency top limit switch
- 3.Wire guides (x4)
- 4.External controls for automatic function (for automatic send configuration only).
- 5.Bottom obstruction device

- 6.Door
- 7.Guard locking switch
- 8.User control box
- 9.Anchor points (x2)
- 10.Main control box

Traction system

Fall arrest device

3.6.2 Traction system

Service Lift	Hoist	Lifting capacity	Wire rope speed	Power	Rated current	Traction wire rope Ø	Unit weight approx.
Version	Traction system type	Kg	m/min	kW	A	mm	Kg
Shark L 02	M508 / 400V 50Hz	500	18	1.5	4.1	8.4	50
Shark L 02	M508 / 690V 50Hz	500	18	1.5	2.3	8.4	50
Shark L 02	M508 / 400V 60Hz	500	21	1.8	4.9	8.4	50
Shark L 02	M508 / 690V 60Hz	500	21	1.8	2.8	8.4	50
Shark L 02	M508 / 400V 50Hz	600	18	2	4.4	8.4	55
Shark L 02	M508 / 690V 50Hz	600	18	2	2.6	8.4	55
Shark L 02	M508 / 400V 60Hz	600	21	2.4	5.3	8.4	55
Shark L 02	M508 / 690V 60Hz	600	21	2.4	3.1	8.4	55

3.6.3 Fall arrest device

Service Lift	Fall arrest device	Lifting capacity	Triggering speed	Safety wire rope Ø	Unit weight approx.
Version	Type	Kg (lbs)	m/min (ft/min)	mm	Kg (lbs)
Shark L 02	ASL 508	500 (1100)	30 (100)	8.4	7 (15.4)
Shark L 02	ASL 508	600 (1320)	30 (100)	8.4	7 (15.4)

3.6.4 Traction, safety and guiding wire ropes

Service Lift Version	Wire rope type	Wire rope diameter	Surface Treatment	Mark/feature	Min. break resistance	Attached with
Shark L 02	M508 / ASL 508	8.4 mm, 5x19	HDG	no	55 kN	2 t shackle
Shark L 02	M508 / ASL 508	8.4 mm, 5x19	HDG	no	59 kN	2 t shackle
Shark L 02	Guiding wire rope	12 mm	HDG	no	55 kN	2 t shackle

3.6.5 Main control box

3.6.5.1 Automatic send configuration

3.6.5.2 Send/call configuration

3.6.6 User control box

- 1.. UP button (internal)
2. DOWN button (internal)
3. Emergency stop button (internal)
4. UP button (external)
5. DOWN button (external)
6. Emergency stop button (external)

The automatic send configuration (activated by the external controls) incorporates a delayed response function and an acoustic buzzer on the main control box. This way, persons next to or inside the cabin are warned of imminent movement of service lift and can act accordingly.

The external controls are not included in case of send/call configuration.

All internal controls are Hold to run. The external controls are single press.

3.6.7 Bottom platform control box

A control box is installed at the bottom platform. This control box has a main switch. Turn the switch to the OFF position to cut the power to the service lift. The main switch must be set to OFF when the lift is not in use, when leaving the wind turbine and while the wind turbine is running. It must be set to OFF before starting an electrical generator.

The send and call configuration incorporates a delayed response function and an acoustic buzzer on the main control box. This way, persons next to or inside the cabin are warned of imminent movement of service lift and can act accordingly.

All controls are Hold to run.

3.6.7.1 Automatic send configuration

For automatic send configuration, the installation of a main switch box is optional.

For fence doors with guard locking

For fence doors with trapped key

3.6.7.2 Send/call configuration

1. UP light (green)
2. DOWN light (green)
3. Fault light (red)
4. Ready light (green)
5. Main switch
6. DOWN button
7. Emergency stop button
8. UP button

3.6.8 Top platform control box

A control box is installed at the top platform for send/call configuration.

All controls are Hold to run.

3.6.8.1 Send/call configuration

1. UP button
2. DOWN button
3. Emergency stop button
4. UP light (green)
5. DOWN light (green)
6. Fault light (green)

3.6.9 Intermediate platform control boxes

The control boxes could be installed at the intermediate platforms for send/call configuration.

3.6.9.1 Send/call configuration

3.6.9.1.1 Option 1

1. UP button
2. DOWN button
3. Emergency stop button
4. UP light (green)
5. DOWN light (green)
6. Fault light (green)

All controls are Hold to run.

3.6.9.1.2 Option 2

There is also an option in send/call configuration, in which there are platform control boxes in the top and in the bottom platforms, and in the intermediate, are installed boxes just with emergency stop.

3.6.9.1.3 Option 3

There is a third option in send/call configuration, in which there are just platform control boxes in the top and in the bottom platforms, but not in the intermediate.

3.7 Fence door interlock system

3.7.1 Trapped key system ⁽¹⁾

The platform fence door is fitted with a trapped key lock keeping the door locked while the service lift is not at the platform. The door can be unlocked by using the trapped key on the cabin and opening the trapped key lock. The key will get trapped until the door is closed and locked again.

3.7.2 Guard locking system ¹⁾

The platform fence door could be fitted with an interlock system keeping the door locked while the service lift is not at the platform. The door is unlocked when the service lift is at the platform with the lift detection switch activated. The ready light is ON when the door is closed.

During emergency use, for example, power cut, need of evacuation or rescue, the door guard locking switch can be unlocked by acting the mechanical Door Manual Release system from outside the fence, or from inside the fence.

¹⁾Note: Optional feature.

3.8 Service lift door

During normal use with the service lift plugged into the electric current, the sliding door is closed by pushing the actuator into the door guard locking switch. The control is interrupted if the door is not closed properly.

When the cabin is located on a platform, the lift detection switch is activated and the sliding door can be opened. Inside the cabin there is a handle to help opening the sliding door.

Inside the cabin there is a position platform indicator.

The green light is ON when the lift is positioned on the platform.

During emergency use, for example, power cut, need of evacuation or rescue, the door guard locking switch can be unlocked by pushing Door Manual Release button from outside the cabin, or by using the triangular key from inside the cabin.

3.8.1 Normal use

SLIDE THIS HANDLE TO OPEN THE SLIDING DOOR

3.8.2 Emergency use

INSIDE THE CABIN:

Use triangular key fixed inside the cabin to open the door.

OUTSIDE THE CABIN:

Push red release button.

3.9 Emergency top limit switch

At the top of the cabin a top limit switch will stop ascent when activated. Descent will still be possible. A top limit device activating the top stop switch is installed below the traction wire rope fastenings. Emergency top limit switch interrupts the control if the top limit switch fails. Only manual descent is possible.

When the top limit switch is engaged, press the DOWN button until the top limit switch is released

Do not use the service lift until the top limit switch fault has been rectified.

3.10 Top obstruction device

The top obstruction device switch stops ascent if the service lift:

- encounters an obstacle
- touches the top limit device

Descent will be possible, for instance to remove the obstacle.

3.11 Bottom obstruction device

The bottom obstruction switch stops descent if the service lift:

- encounters an obstacle
- touches the ground

Ascent will be possible, for instance to remove the obstacle.

In order to put the service lift on the ground, the functionality of the Bottom obstruction device can be bypassed with the bottom obstruction override switch in the user control box. To do so, turn the bottom obstruction override switch while pressing the DOWN button.

Release the DOWN button as soon as the rubber bumpers hit the floor. Otherwise the lift or the installation may get damaged.

Bottom obstruction device

Bottom obstruction switch

Note: Shark L 02 could feature top obstruction plate or top obstruction frame

3.12 Manual descent system

The service lift features a manual descent system that can be used in case of no power emergency situation. It is activated by pushing the manual descent actuator upwards. Push and hold the actuator upwards to release the motor brake. Push up the actuator completely to avoid excessive wear and overheating the electro - mechanic brake. The electromagnetic motor brake is then released. The service lift descends with a controlled speed limited by means of a centrifugal brake installed between the motor shaft and the gear box.

Optionally a safety switch can be installed. When the manual descent actuator is pushed upwards, the brake release switch is activated. The brake release switch will interrupt any control function, and activates a buzzer that sounds during manual descent.

- Fixed steps are provided for access to the fall arrest device levers. The user must observe all safety precautions and check that the lift doors are closed before climbing on it.
- To engage the fall arrest device: Turn the stop lever counter clockwise.
- To release the fall arrest device: Turn the release lever clockwise.

3.13 Fall arrest device

The service lift is equipped with a fall arrest device which will be triggered in case of an overspeed condition. The speed of the safety wire rope passing through the device is continuously monitored, and the jaws are automatically closed in the event of sudden excessive speed.

Tightness of safety wire rope must be frequently inspected to ensure full functionality of fall arrest device!

This device protects the service lift against traction wire rope breakages or traction system failures. The fall arrest device can also be engaged or disengaged manually by pulling downwards knobs on the back of the lift, or by acting directly on the fall arrest device levers.

BEFORE CLIMBING on steps, CHECK that required PFPEs are used, the cabin doors are closed and personnel is hooked to anchor points inside cabin

*During manual descent, the door of the lift shall be kept closed.
Do not extend body parts outside the cabin during travel.*

3.14 Overload limiter

A lifting force limiter is built into the wire rope traction system and will prevent upward travel in the event of overload. In case of overload, the lift's upward travel will be blocked, and a buzzer will sound in the user control box. The buzzer will stop only when the cause of the overload has been removed.

- Reduce the load to below the overload limit.
- Lower the lift until it is free of the obstacle and remove the obstacle before using the lift again

On entering and starting the lift, the buzzer may sound briefly. This is due to temporary load peaks occurring as the lift takes off. The control box is designed not to activate the buzzer or stop the lift because of peak loads caused by the cabin swinging.

Attempting to run an overloaded lift is prohibited!

3.15 Slack rope sensor ¹⁾

Installed on the top of the service lift, over the traction hoist, when engaged it interrupts descent. It detects slack traction wire rope.

3.16 Warning light

A set of warning lights is mounted on the top and at the base of the lift. The flashes warn that the lift is moving.

3.17 Acoustic buzzer

An audible signal is installed with a warning function.

In case of using the external user control box, or the platform control boxes, the operation will provide delay with sound warning the users of the imminent movement, so persons next to or inside the cabin are warned and can act accordingly.

3.18 Anchor points

The service lift is equipped with two anchor points inside the cabin. During operation personnel shall hook themselves up to the anchor points inside the cabin. In case of need of evacuation, the evacuation procedure must be observed.

3.19 Internal light ¹⁾

Optionally, the service lift can be equipped with a light inside the cabin. There can be two models:

- Service light: when service lift is connected to power supply, this light illuminates at all times.
- Service and emergency light: when service lift is connected to power supply, this light illuminates at all times, and it is also battery packed in order to illuminate the inside of the cabin in case of a power failure (once charged).

¹⁾ Note: Optional for Shark L 02.

3.20 Guiding system

The service lift is guided along the guiding wire ropes by means of plastic wireguides or roller guides.

Standard plastic wireguides

Narrow plastic wireguides

Roller guides

3.21 Control cable management

The control cable coils inside a bin placed under the cabin.

The travelling cable pulley straightens the cable at all possible positions of the service lift. It is installed instead of the cable bin. The travelling cable pulley is included as an optional feature for automatic send configuration, but mandatory for send/call configuration.

The lift could feature a cable force switch. This switch prevents ascend and descent in case of supply cable is blocked or entangled in the travel path. It is included as an option in both supply cable configurations (travelling or trailing).

Cable force switch

3.22 Catwalk

Optionally, an extendable platform (called catwalk) can be installed in front of the lift, under the sliding door, in order to make safer the evacuation procedure.

This platform has a safety switch that, when is extended, prevents the service lift from moving.

Before performing a manual descent (ONLY for emergency), ensure that catwalk is closed.

3.23 Maintenance windows

The cabin has two lateral windows that are removable to facilitate maintenance tasks on the tower from inside the lift.

The cabin has also two back windows that are removable to facilitate inspection and maintenance tasks of traction and safety wire ropes from inside the cabin.

These windows shall be used only in special cases such as corrective maintenance and installation of tower components. These windows shall not to be used for preventive or normal maintenance tasks.

During maintenance and/or installation tasks through these windows, the emergency stop of cabin control box must be always activated.

3.24 Information signs and documents

The following documents, signs and labels are supplied with the service lift and shall always be available.

Location	Document
Cabin	Serial number plate
	Manual document inside blue bag
	Quick guide document
	Evacuation guide
	Use of PFPE label sign
	Working load limit / No persons label
	Emergency manual release sticker
Main control box	Wiring diagram
	Electrical hazard warning label

4. Instructions for use

4.1 Daily inspection

Travel zone:

Ensure that there are no obstacles in the travel zone which may obstruct the travel of the service lift.

Service lift:

1. Check that the service lift components are mounted in accordance with the specifications and without any noticeable defects or missing components
2. Check that the traction and safety wire ropes are not damaged or jammed
3. Check that the safety devices are in place and working:
 - 3.1 Main switch: Turn the main switch on the bottom platform control box to the OFF position. The green light must be OFF. The service lift must not run. Turn it ON, the light shall be ON.
 - 3.2 Green light (Ready) – Service lift: Close and lock the bottom platform gallery door and the service lift door. Turn the trapped key to the ON position (if installed). The green light must be ON. It should not be possible to remove the trapped key unless it is switched OFF again.
 - 3.3 Emergency stop button: Press the emergency stop button on the cabin control box. The service lift should not move UP / DOWN. Release the emergency stop and drive the lift UP approximately 1 meter.
 - 3.4 Service lift door: Pull the door to open. The door should not open. Unlock the sliding door. The sliding door should open, the green light must be OFF and the lift must not move UP /DOWN. Close the sliding door and apply the lock to the sliding door.
 - 3.5 Ascend lift electrically a few centimeters and observe centrifugal weight during this. Activate the fall arrest device by turning the lock lever counter clockwise. Press and hold the DOWN button of the cabin control box. The service lift should not descend. Try to perform manual descent and observe centrifugal weight during this. The FAD should hold the load (if not, leave the lift and tag it out). Ascend electrically again to unload the FAD. Unlock the fall arrest device by turning the unlock lever clockwise. There is an alternative method to check the FAD functionality, called 'Stomp Test'. The procedure is explained in the 'Stomp-test Instruction' Appendix.
 - 3.6 Perform a manual descent test for a meter. The lift should descend and the buzzer should sound (if installed).
 - 3.7 Drive the service lift down until the Bottom obstruction device hits the bottom platform. The service lift should stop before the rubber bumpers hit the bottom platform. The service lift door and the fence door should be unlocked.
 - 3.8 Top obstruction device: activate top stop by pressing it down. The service lift should not ascend until top obstruction device is released.
 - 3.9 Slack rope sensor 1): Activate the slack rope sensor by manually pulling the traction wire rope upwards. Descent should not be possible.

4. When the lift is at the top platform, check the wire rope fastenings.

5. Record the hour meter reading in the "Inspection Log Sheet" Appendix.

1) Note: Optional for Shark L.

If any faults occur during work,
- stop working,
- if required secure the workplace and
- rectify the fault!

Make sure that nobody is exposed to danger below the service lift, for instance from falling parts.

Cabin control from outside of the cabin- Automatic:

The automatic mode function is available from the control buttons outside of the cabin and at the platforms. It shall be checked as follows:

1. Turn the main control box selector to AUTOMATIC. Press the UP button on the control box. The lift should ascend.
2. Press the emergency stop button on the control box. The lift stops.
3. Pull the emergency stop button and press the DOWN button. The service lift should descend until the bottom obstruction device engages.

The daily inspection must be recorded for future reference (filling in the "Inspection Log Sheet" Appendix).

4.2 Prohibited uses

The consequences of not following below STOP prohibitions are extremely hazardous to the physical integrity of the users.

When using the service lift it is prohibited to:

- Use the service lift beyond its intended purpose.
- Operate the service lift without following the safety warnings and operating instructions.
- Overload the service lift
- Try to repair machine components. Only Certified Technicians are allowed to perform service on the machine.
- To manipulate switches and safeties.
- To place objects on service lift roof.
- To travel on service lift roof.
- To use the emergency manual release of the guard locking of door lift or fence doors during normal use.
- To disattach trapped key from wire rope.
- To have a second trapped key.

4.3 Operation from inside the cabin (manual)

If fence doors feature guard locking system:

1. Turn the main switch of the bottom platform control box to the ON position (if installed).
2. Enter the service lift, close the bottom fence door, and the cabin door.
3. Turn the the main control box selector to MANUAL (if installed).
4. To go up or down, press and hold the UP or DOWN button as needed.

If fence doors feature trapped key system:

1. Turn the main switch of the bottom platform control box to the ON position (if installed).
2. Open the cabin door, take the trapped key and open the bottom fence door.
3. Enter the service lift, close and lock the bottom fence door.
4. Turn the trapped key switch to ON, and close the cabin door.
5. Turn the the main control box selector to MANUAL (if installed).
6. To go up or down, press and hold the UP or DOWN button as needed

In the event of traction wire rope breaks or traction hoist fails, evacuate the service lift.

Before closing the lift door, ensure that your equipment (i.e.lanyards) do not get trapped/ tangled with the closing door and/or with surrounding elements.

To prevent the lanyards from tangling with surrounding elements, keep them properly attached to your body harness.

To prevent the lanyards from tangling with the moving service lift, do not get close to the hoistway.

4.4 Operation from outside the cabin (automatic send)

Transportation of people is forbidden if the operation is controlled from outside the service lift.

4.4.1 Bottom platform

When fence doors feature guard locking system:

1. Turn the main switch of the platform control box to the ON position (if installed).
2. Open the bottom fence door, and the cabin door.

3. Turn the main control box selector to AUTOMATIC. Exit the cabin, close the cabin door and the bottom fence door.
4. Press the external UP button.

When fence doors feature trapped key system:

1. Turn the main switch of the platform control box to the ON position (if installed).
2. Open the cabin door, take the trapped key and open the bottom fence door.
3. Turn the main control box selector to AUTOMATIC.
4. Exit the cabin, close and lock the bottom fence door.
5. Turn the trapped key switch to ON, and close the cabin door.
6. Press the external UP button.

4.4.2 Top platform

When fence doors feature guard locking system:

1. Open the top fence door, and the cabin door.
2. Turn the main control box selector to AUTOMATIC.
3. Exit the cabin, close the cabin door and the bottom fence door.
4. Press the external DOWN button.

When fence doors feature trapped key system:

1. Open the cabin door, take the trapped key and open the top fence door.
2. Turn the main control box selector to AUTOMATIC.
3. Exit the cabin, close and lock the top fence door.
4. Turn the trapped key switch to ON, and close the cabin door.
5. Press the external DOWN button.

4.5 Operation from the platform control boxes

When fence doors feature guard locking system:

1. Open the cabin door, and the fence door.
2. Exit the cabin, close the cabin door and the fence door.
3. Press and hold the platform control box UP or DOWN button to ascend or descend the cabin.

When fence doors feature trapped key system:

1. Open the cabin door, take the trapped key and open the fence door.
2. Exit the cabin, close and lock the fence door.
3. Turn the trapped key switch to ON, and close the cabin door.
4. Press and hold the platform control box UP or DOWN button to ascend or descend the cabin.

When the UP or DOWN button of a external control box (platform or cabin) is pressed , the response of the cabin is delayed. During this delay, an acoustic signal will sound. This way, any personnel in the surroundings are warned of the imminent movement of the service lift.

Transportation of people is forbidden if the operation is controlled from a platform control box.

Before closing the lift door, ensure that your equipment (i.e.lanyards) do not get trapped/ tangled with the closing door and/or with surrounding elements.

To prevent the lanyards from tangling with surrounding elements, keep them properly attached to your body harness.

To prevent the lanyards from tangling with the moving service lift, do not get close to the hoistway.

4.6 Fall arrest device

If the fall arrest device engages simply disengage it by turning the “Unlock” lever clockwise until the fall arrest device is unlocked.

However, this is not possible if the safety wire rope is under tension. If this is the case:

1. Remove the load on the safety wire rope by pushing the UP button ascending the service lift a few centimetres.
2. Manually open the fall arrest device by turning the “Unlock” lever clockwise until the fall arrest device is unlocked.

In case of power failure and the fall arrest device is locked with the safety wire rope under tension evacuate the lift according to the evacuation procedure.

The safety wire rope and the attachment between the fall arrest device and the service lift are exposed to dynamic loads when a fall is prevented. When the service lift has returned to the bottom platform, test the fall arrest device functionality. Replace any defective fall arrest device components and return them for repair to AVANTI. If the FAD damper has moved downwards, the FAD unit must be replaced by a certified technician.

4.7 Manual descent

In case of power failure, a manual descent without power can be performed. To do so:

1. Verify that the fall arrest device is unlocked.
2. Check that there are no obstacles or persons in the travel zone.
3. Take the manual descent actuator from its holder

and insert it on the lever extension tube.

4. Push the manual descent actuator upwards. The service lift will start descent and a buzzer will sound (if installed).

5. To stop the manual descent, stop pushing upwards.

6. Every time that a whole tower height manual descent is performed, the system must be checked by a certified technician.

During the manual descent, the door and windows/covers of the lift shall be kept closed.

Use the walkie-talkie to report about the manual descent.

During the manual descent, stop the service lift just before reaching the bottom platform floor. This way, the bottom obstruction device will not get damaged.

4.8 Lateral removable windows

To open the windows:

1. Press the emergency stop button of the cabin control box.
2. Remove the lateral windows from the cabin lateral panels by unscrewing its riveted screws with a Torx screwdriver.

To close the windows:

1. Install the lateral windows by screwing its riveted screws back on the cabin lateral panels with a Torx screwdriver.
2. Press and turn the emergency stop button of the cabin control box.

The lateral removable windows shall only be used by certified technicians.

The lateral removable windows shall only be used for maintenance tasks.

4.9 Cabin maintenance covers

To open the covers:

1. Press the emergency stop button of the cabin control box.
2. Remove the covers from the cabin back panels by unscrewing its riveted screws with a Torx screwdriver.

To close the covers:

1. Install the maintenance covers by screwing its riveted screws on the cabin back panels with a Torx screwdriver.
2. Press and turn the emergency stop button of the cabin control box.

The cabin maintenance covers shall only be used by certified technicians.

The cabin maintenance covers shall only be used for maintenance tasks.

4.10 Troubleshooting

1. All tests and repairs to the electronic components should be performed by **certified technicians only!** The wiring diagram is placed in the power cabinet.

2. Repairs to the traction hoist, the fall arrest device and to the system's supporting components should be performed by **certified technicians only!**

Breakdown	Cause	Solution
<p>The service lift will neither go up nor down!</p> 	 DANGER! <i>Attempting to use the lift will jeopardize work safety.</i>	
	A1 The fixed EMERGENCY STOP button has been activated.	Deactivate the button in question by pulling it until it pops out.
	A2 Wire rope loop on traction hoist. Damaged or defective wire rope or wire rope outlet causes problems.	Stop work immediately! Ask the supplier or manufacturer for help.
	A3 The fall arrest device is holding the service lift on the safety wire. a) Lift wire rope breakage b) Hoist failure	a) + b) Evacuate the service lift according to the "Evacuation guide".
	A4 The service lift is stuck on an obstacle.	Carefully remove the obstacle. Test the operational safety of affected tower sections. Inform the supervisor.
	A5 Power failure a) Control not switched on or deactivated. b) Grid voltage interrupted. c) Supply between grid connection and control interrupted.	a) Turn EMERGENCY STOP button to the right until it is released. b) Find the cause and wait for the power to return. c) Test and if necessary repair the supply cable, fuses, and/or wiring from the control box.
	A6 Safety switch is triggered a) EMERGENCY top limit switch was pressed. b) Door switch is not properly closed or is defective.	a) Perform manual descent until the emergency top limit switch is released. b) Close the door and test the door switch.
	A7 Protection switch on overheating a) A phase is missing b) Motor is not cooling c) Voltage too high/low	a) Test/repair fuses, supply and connection. b) Clean the hood. c) Measure voltage and power consumption on the loaded motor. If voltage deviates from specifications, use cable with increased dimensions.
	A8 Brake does not open (no click on on/off) a) Supply, braking coil or rectifier defective. b) Braking rotor closes.	a) Have a certified technician, repair/replace the supply, braking coil and rectifier. b) Return traction hoist for repair.

DANGER!

Unplug the power supply before opening the power cabinet.

Breakdown	Cause	Solution
<p>The service lift will neither go up nor down!</p> 	A9 If guard locking system of fences is provided: the guard locking switch and/or interlock control box is defective.	Test / Repair defective components.
	A10 The key switch (if installed) ON/OFF has not been activated.	Turn the key to ON.
	A11 The main switch is in the OFF position.	Turn the main switch ON.
	A12 The product is stuck on an obstacle below it.	Evacuate the service lift - Inform the supervisor. - Check the bottom obstruction device connection/ function. Replace if necessary. - Check the slack rope sensor 1) connection/ function. Replace if necessary. <i>1)Note: Optional feature.</i>
	A13 Cable force switch (if installed) is activated.	a) Perform manual descent until the switch is released. b) Release the cable from the entanglement.
	A14 Catwalk switch (if installed) is activated.	- Check if catwalk is completely closed and blocked. - Check the catwalk switch connection/function. Replace if necessary.
<p>Service lift goes down but not up</p> 	 <i>Irresponsible behaviour jeopardizes system safety!</i> B1 The service lift is stuck on an obstacle.	Carefully move the service lift downwards and remove the obstacle. Test the operational safety of affected platform components. Inform the supervisor.
	B2 Top obstruction switch: a) Top obstruction switch is defective or not connected properly. b) Top obstruction switch is activated.	a) Test the top obstruction switch connection/function. Replace if necessary. b) Move lift down until the top obstruction switch is released.
	B3 A phase is missing	Test fuses and power supply.
	B4 Fault in UP control circuit in control box or traction system	Test and possibly repair connections, wiring and relays.
	B5 Service lift is overloaded (buzzer sounds).	Test and/or reduce load until buzzer stops.
 DANGER! <i>Unplug the power supply before opening the power cabinet.</i>	C1 Wire ropes dirty  WARNING! <i>Further use of lift may result in damage to the wire rope traction.</i>	If possible, immediately replace the traction system and return it for test/repair at AVANTI.
<p>Motor hums loudly or wire ropes squeak, but the lift can go both up and down.</p>		

Breakdown	Cause	Solution
<p>Service lift will go up but not down!</p>  <div data-bbox="138 577 422 798">  <p>DANGER!</p> <p>Unplug the power supply before opening the power cabinet.</p> </div>	<p> <i>Irresponsible behaviour jeopardizes system safety!</i></p> <p>D1 The service lift has encountered or is stuck on an obstacle.</p>	Carefully take the service lift up and remove the obstacle. Test the operational safety of affected platform components. Inform the supervisor.
	<p>D2 The fall arrest device is holding the service lift on the wire rope.</p> <p>a) Excessive hoist speed b) Too low release speed on fall arrest device.</p>	a) + b) Take the service lift upwards to relieve the safety wire rope. unlock the fall arrest device by turning the unlocking lever, and test its function.
	<p> <i>A defective fall arrest device will threaten the safety of the service lift!</i></p> <p><i>Replace immediately!</i></p>	Functional test when the lift is back on the ground: Replace the hoist and fall arrest device and return them for testing.
	D3 Fault in down controller circuit on traction system	Insert brake lever into the traction system and lower lift manually. Test, and if necessary have connections, wiring, and relays repaired.
	<p>D4 Bottom obstruction switch:</p> <p>a) Bottom obstruction switch is defective or not connected properly. b) Bottom obstruction switch is activated.</p>	a) Test the bottom obstruction switch connection/function. Replace if necessary. b) Move lift up until the bottom obstruction switch is released.
	D5 Slack rope sensor is engaged (if installed):	Check the reason why it is engaged, possibly it's an obstacle under the service lift or the bottom obstruction device is not functioning properly.
Button lamp not lit although operation is normal.	E A lamp is defective	Have an electrician replace it.
Hoist goes down when up button is pressed and up when down button is pressed.	F Two phases changed in the supply.	Have an electrician switch the 2 phases in the plug.
Loud noise and / or smoke coming from hoist motor	<p>G Brake closed or partially closed</p> <p>WARNING ! Damage of hoist brake leading to brake function lost</p>	Stop work immediately! Call supervisor for advice and potential repair of hoist

*If these steps do not identify the cause and rectify the fault:
Consult a certified technician or contact the manufacturer.*

4.11 Out of service

1. Securing the service lift:

Bring the service lift all the way down, until the bottom obstruction device stops the cabin.

2. Turn off the main switch to prevent inadvertent operation of the lift:

Turn the main switch to the OFF position
– Power supply is now interrupted. Mark the lift “OUT OF SERVICE”. Contact the service technician for repair.

Appendix B: Stomp-test Instruction

Alternative way to inspect the ASL during Daily Inspection before Operation

Purpose

This instruction may be a substituting part of the Daily Lift Checking to be used by authorized users and Certified technicians. The information describes an alternative way of how to check the over speed triggering and arresting function in the Avanti Safety Fall Arrest Device model ASL. Second, the test also documents that the Safety Brake maintains its grip on the Safety Wire after engagement. This testing we name the “Stomp-test”.

This stomp-test-method may replace the given daily obligation in your manual explaining “to descend the lift, manually engage the FAD (Fall Arrest Device), verification by short no-powerdescent, unloading the FAD again by ascending and observing centrifugal weight unit through the window during lift use”. With the “Stomp-test” we test the ability of the FAD to trigger in case of over speed and arrest the load.

Tools: None

Measurement Equipment: None

Validity

It is applicable for testing the installed Safety Fall Arrest Device (ASL) on-site. The test must only be performed by trained users/Certified technicians and always with respect of all the relevant safety regulations.

Cautions

Be aware that the instruction only explains the steps of how to execute the “Stomp test” in the lift installation; it doesn’t guide any safety precautions and the necessary use of safety equipment.

Therefore, Avanti strongly recommends you to read and understand what the physical work steps in the “Stomp-test” are, and then execute your own Risk and Hazard Assessment according to the valid safety working procedures in your own organisation before starting the test.

1. Test Preparation

The cabin (with 1 person inside) is ascended with a service lift user inside, and the cabin bottom is positioned (“parked”) in a height of app. 3 m/10 ft. above the bottom landing floor platform.

2. Test Step

With the cabin in “parked” position app. 3 m/10 ft. above the bottom landing floor, the user starts descending by electrical power using the push down button. When the cabin starts descending the user executes a hard stomp with one foot in the cabin floor – The hard stomp is executed by lifting one foot, so the lower leg is positioned with a knee angle of 90 degrees – Then immediately after the foot is stomped in the cabin floor -The user must make sure to have a solid footing during the foot stomp!

The foot stomp should engage the ASL and arrest the electrical descent of the cabin, the red light (if existing in the control box) should turn “on” and the cabin load should be hanging on the FAD/Safety Wire.

If the ASL doesn’t arrest at the first trial, then re-establish the cabin in the position described in the preparation part mentioned above and execute the “Step” once again stomping a little harder.

3. Test Result

If the ASL activates properly after the stomp, the ASL will now hold the cabin on the Safety Wire.

In order to ensure important maintaining grip by the Safety Brake, the user then activates the manual descent function and result shall be a Safety Fall Arrest Device ASL holding the cabin fixed on the Safety Wire (manual descending is not possible).

- If the activated ASL fixes the cabin on the Safety Wire while manual descent is activated, the Safety Fall Arrest Device (ASL) is in good and operational condition.

In order to release the activated ASL push the ascent button up a little before releasing the ASL by the unlocking handle.

- **If the ASL can’t activate** after first or second “Stomp-test”, or can’t fix the cabin in activated position

- User must immediately bring the cabin down and park it at the bottom landing platform floor.

- Lock Out the installation from use and contact Avanti for further approach!

- Document the execution of the above described procedure in the Daily Inspection Log Appendix.

Any doubts regarding above instruction, please do not hesitate to contact Avanti’s local representative for help.
